PROFESSIONAL SUMMARY

Software engineer with 13+ years across commercial applications and financial-market core systems. Recently focused on agentic AI, MCP tool orchestration, cross-device execution, and human-in-the-loop workflows. Built PickPico, awarded third place at the 2026 SITCON Hackathon, while bringing production-debugging and reliability experience to practical agent systems.

I combine a background in reliable trading-system integration and production troubleshooting with hands-on agent runtime, tool calling, and execution-state management. I own product scope, system boundaries, validation and security trade-offs, while collaborating extensively with AI coding tools on implementation; projects are verified against real devices and workflows.

HACKATHON HIGHLIGHTS

2026 SITCON Hackathon · Third Place · PickPico: an Android agent tool platform with MCP, remote execution, and human-in-the-loop control.

2026 Hotai AI Hackathon · Proposal Submission · iRent TIME LENS: a proposal for a vehicle-damage timeline and before/after inspection comparison.

PROFESSIONAL EXPERIENCE

Taishin International Bank — 2015–2026

Senior Software Engineer | FX Trading & Financial Markets Core Systems

More than a decade developing and supporting FX trading and financial-market core systems, spanning Murex, MLC, pre-trade rules, STP flows, trading limits, and integrations with multiple counterparty banks.

- Primary owner for MLC, with independent delivery of pre-trade rules and broad long-term involvement across Murex functions and upgrade work.
- Built multiple STP flows from the ground up: receive counterparty-bank XML confirmations, parse and map fields, convert formats, and import trades into Murex; failures trigger email notifications with actionable error details.
- Integrated with multiple counterparty banks across XML, CSV, MQ, sockets, SFTP, and scheduled/batch boundaries.
- Continued delivering new automation near the end of tenure, including SPARK / TMU back-to-back trading flows for traders.

Kewei Information — 2012–2015

FAE Team Lead

Travel-industry ERP vendor. Started with Classic ASP backend development and maintenance, then led a three-person FAE team responsible for diagnosing and fixing production issues in commercial ERP deployments.

- Developed and maintained backend functionality for a travel ERP product and supported live customer environments.
- Led a three-person FAE team that reproduced, isolated, and fixed production bugs while coordinating verification with development and customer-side users.
- Built a foundation in long-lived application maintenance, commercial-system debugging, and engineering against real operational constraints.

SELECTED PROJECTS

PickPico

SITCON 2026 · 3rd Place · Public Release

Third place at the 2026 SITCON Hackathon. Turns an Android phone into an MCP-enabled tool node for AI agents, using a cloud relay for remote device actions and explicit human approval where needed.

Role: I defined the system concept, tool boundaries, consent flow, and integration across Android, MCP, relay, and ESP32 hardware. AI coding agents helped with implementation and iteration; I validated real-device behavior, reliability, and the delivered result.

CLI Monitor v2

Daily Use · Private

A daily-use control plane for stateful AI coding CLIs, PTYs, remote messaging channels, scheduled jobs, process lifecycle, and browser-based operator control.

Role: This is a private production tool. I continuously turn failures and operational friction from daily use into system boundaries, state models, validation rules, and security constraints; AI coding agents assist heavily with TypeScript implementation, tests, refactoring, and documentation.

coding-tools MCP

Private · Internal Tool

Built on existing MCP tooling and heavily customized into a personal AI engineering collaboration layer, allowing cloud conversational AI such as Web ChatGPT to work directly with approved local workspaces, shells, devices, and development environments.

Role: I started from existing MCP tooling and, through sustained real use, kept redefining tool contracts around actual model failure modes, then validating whether the changes improved collaboration. AI coding agents assisted with implementation.

TECHNICAL FOUNDATION

C# · VB.NET · Classic ASP · SQL · Oracle · SQL Server · Stored Procedure · Windows Service · IIS · MQ · Socket · SFTP · XML · CSV · Batch · Scheduler · Windows Server · Linux · Git · SVN · TFS · Murex · STP

RECENT HANDS-ON

Agent Orchestration · MCP / Tool Calling · Human-in-the-loop · TypeScript · Node.js · Python · Android · ADB · Cloudflare Durable Objects · WebSocket · WebRTC · HTML / CSS · PWA · GitHub Actions · C# Host

EDUCATION

National Taipei College of Business
Department of Information Management | Five-year junior college + two-year technical program

LANGUAGES

Mandarin Chinese: Native
English: Comfortable reading technical documentation; written communication can be supported by modern tools.
