PROFESSIONAL SUMMARY

Software engineer with 16 years of experience across commercial ERP systems and financial-market infrastructure. In recent years, I have extended that foundation into full-stack and AI application engineering, using modern AI coding tools to turn real operational needs into products I use daily or ship publicly.

I work problem-first rather than stack-first: define the constraint, choose an appropriate approach, test it against reality, and keep or discard it based on results. AI coding tools handle a large share of implementation, exploration, refactoring, and debugging assistance; I remain responsible for product definition, system boundaries, engineering trade-offs, real-device validation, root-cause reasoning, and final quality.

PROFESSIONAL EXPERIENCE

Taishin International Bank

2015–2026

Senior Software Engineer · Assistant Manager grade | FX Trading, Financial Markets Core Systems

More than a decade developing and supporting FX trading and financial-market core systems, spanning Murex, MLC, pre-trade rules, STP flows, trading limits, and integrations with multiple counterparty banks.

- Primary owner for MLC, with independent delivery of pre-trade rules and broad long-term involvement across Murex functions and upgrade work.
- Built multiple STP flows from the ground up: receive counterparty-bank XML confirmations, parse and map fields, convert formats, and import trades into Murex; failures trigger email notifications with actionable error details.
- Integrated with multiple counterparty banks across XML, CSV, MQ, sockets, SFTP, and scheduled/batch boundaries.
- Continued delivering new automation near the end of tenure, including SPARK / TMU back-to-back trading flows for traders.

Kewei Information

2010–2015

FAE Team Lead

Travel-industry ERP vendor. Started with Classic ASP backend development and maintenance, then led a three-person FAE team responsible for diagnosing and fixing production issues in commercial ERP deployments.

- Developed and maintained backend functionality for a travel ERP product and supported live customer environments.
- Led a three-person FAE team that reproduced, isolated, and fixed production bugs while coordinating verification with development and customer-side users.
- Built a foundation in long-lived application maintenance, commercial-system debugging, and engineering against real operational constraints.

SELECTED PROJECTS

VibeDeck

Public Release

Turns spare phones, tablets, and other browser-capable devices into a real Windows display or a customizable information deck.

Role: I defined the product, device/Windows boundaries, feature trade-offs, validation strategy, and final UX. ChatGPT, Codex, Claude, and other AI tools assisted with architecture exploration, implementation, refactoring, and debugging. Real-device tests repeatedly rejected approaches that looked sound on paper but failed on latency or compatibility.

CLI Monitor v2

Daily Use · Private · Case Study

A daily-use control plane for stateful AI coding CLIs, PTYs, remote messaging channels, scheduled jobs, process lifecycle, and browser-based operator control.

Role: This is a private production tool. I continuously turn failures and operational friction from daily use into system boundaries, state models, validation rules, and security constraints; AI coding agents assist heavily with TypeScript implementation, tests, refactoring, and case-study preparation.

coding-tools MCP

Private · Internal Tool · Case Study

A heavily customized MCP toolset evolved into a personal AI engineering collaboration layer that connects conversational AI with local workspaces, shells, devices, and development environments.

Role: This was not built from scratch. I started from existing MCP tooling and, through sustained real use, kept redefining tool contracts around actual model failure modes, then validating whether the changes improved collaboration. AI coding agents assisted with implementation.

TECHNICAL FOUNDATION

C# · VB.NET · Classic ASP · SQL · Oracle · SQL Server · Stored Procedure · Windows Service · IIS · MQ · Socket · SFTP · XML · CSV · Batch · Scheduler · Windows Server · Linux · Git · SVN · TFS · Murex · STP

RECENT HANDS-ON

TypeScript · Node.js · HTML / CSS · WebSocket · WebRTC · Python · PWA · Cloudflare · GitHub Actions · Android · ADB · MCP · AI SDK · C# Host

EDUCATION

National Taipei College of Business
Department of Information Management | Five-year junior college + two-year technical program

LANGUAGES

Mandarin Chinese: Native
English: Comfortable reading technical documentation; written communication can be tool-assisted. Speaking and spontaneous conversation are more limited.
